

# Radon Exhalation from Structural Walls in Heritage Buildings

21-22 April 2026, Workshop, Madrid, "Climate Change, Ventilation and Resilience"

Borja Frutos Vázquez. Ph.D. Architecture

*InstitutE for Construction Science EDUARDO TORROJA (CSIC)*

## OVERVIEW

---

- **CONTEXT.** Radon contamination
- **RADON IN BUILDINGS.** Sources, Transport physics and accumulation
- Special case of **HISTORIC BUILDINGS**
- **RADIANT project.** Singular studies in heritage buildings. Approaches to mitigation proposals

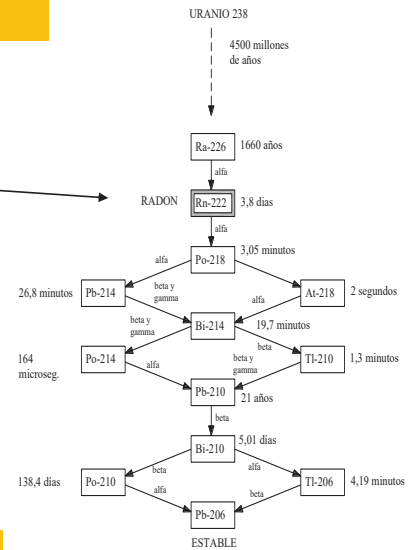

# CONTEXT. Radon contamination

## RADON: Radioactive Element. Isotope (Rn-222)

- Naturally occurring gas whose primary source is the ground (Earth's crust)
- Decay chain of U-238: (*Uranium* → *Radium* → *Radon*)

## RADON: Chemical Element

- Inert gas: chemically stable
- Density: **9.73 kg/m<sup>3</sup>** (at 0 °C and 1 atmosphere) **heavier than air**
- Colourless, odourless, tasteless
- Soluble in water and other liquids

## HEALTH: When inhaled, radon brings radiation closer to sensitive tissues

- Classified as a Group 1 carcinogen (WHO)
- Second leading cause of lung cancer, after tobacco smoking
- 15% of lung cancer cases worldwide are caused by radon
- Comparable to deaths from road traffic accidents

# RADON IN BUILDINGS. Sources, transport physics and accumulation

**Accumulation:** increasing RISK > 300 Bq/m<sup>3</sup>

## Transport physics

**Diffusion:** ( $C_{\text{soil}} > C_{\text{in}}$ )

$D_e$ : Diffusion coefficient

(Through material/SLOW)

**Advection:** ( $P_B > P_A$ )

$K$ : Permeability

(Through cracks, joints/FAST)

$$\frac{\partial \beta C}{\partial t} = \underbrace{\beta D_e \nabla^2 C}_{\text{DIFUSIÓN}} + \underbrace{\frac{k}{\mu} \nabla C \nabla P}_{\text{ADVECCIÓN}} + \underbrace{\varepsilon G - \lambda \varepsilon C}_{\text{GENERACIÓN Y DESINTEGRACIÓN}}$$

Common entry paths (source: B. Frutos. European Atlas of Natural Radiation)

Radon generation IN SOIL

European Atlas Natural Radiation

# RADON SOURCES

## SOIL Emanation and exhalation process

- Uranium concentration in soil
- Soil permeability

ROCK	Content URANIO U <sup>238</sup>
Basalts	1,0 (ppm)
Granite	5,0 (ppm)
Clays	3,7 (ppm)
Sand	0,5 (ppm)

Radón, un gas radiactivo de origen natural". CSN y Universidad de Cantabria

## CONSTRUCTION MATERIAL

Exhalation rate:

$$J_w = R \cdot E \cdot \lambda \cdot \rho \cdot L \cdot \tanh(d/L)$$

- R: Radio content;
- E: Emanation fraction;
- λ: Decay; ρ: Density;
- L: Diffusion Length;
- d: Thickness

Radium – 226 content	
Construction material	[Bq/kg]
Bricks	45.2 - 143
Concrete	21.1 - 192
Mortars	19.8 - 82
Ceramic Tiles	63.0 - 117
Sand	13.3 - 41
Clay	40.9 - 199
Cement	36.5 - 88
Gypsum	12.1 - 86

## Special case of HISTORIC BUILDINGS

### Torre de Hércules. Coruña

Level	High from the ground (m)	Mean Concentration (Bq/m <sup>3</sup> )
Excavation	0	1178
Ground Storey	3.7	666
1 <sup>st</sup> Storey	13.2	1196
2 <sup>nd</sup> Storey	22.9	1429
3 <sup>rd</sup> Storey	37.2	1200

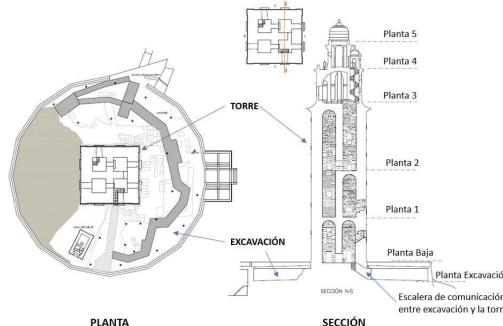

#### PROBLEM DETECTED

- High level of radon activity concentration
- Similar in all floors

No apparent dependence on the distance from the ground!

Mean concentration (CR-39 detectors; 101 days. Gal RaD lab. U. Santiago de Compostela)

M Lorenzo-González et al (2017). Residential radon in Galicia: A cross-sectional study in a radon-prone area. Journal of Radiological Protection.

Internal spaces in the Tower

Basement. archaeological excavation

# Measuring the contribution of radon from building systems

ISO 11665-7:2016: *Measurement of radioactivity in the environment — Air: radon-222. Part 7: Accumulation method for estimating surface exhalation rate.*

Constructive element	Φ =Surface exhalation rate (Bq/m <sup>2</sup> .h)	Remarks on seals
Internal Wall. 1.4m thick. Opus Vittatum	120.0	With joint
Facade Wall. 2.3m thick. Opus Vittatum	180.6	With joint
Granite ashlar Opus Queadratum	13.0	Without joint
Granite floor over soil	117.0	With joint
Granite floor over vault	538.8	With joint

Borja Frutos. Instituto de Ciencias de la Construcción Eduardo Torroja (CSIC)

## PAVEMENTS

Epoxi coating  
0.2 Bq/m<sup>2</sup>.h

Floor tiles, with and without joints, on ground  
0,63 Bq/m<sup>2</sup>.h (without joints)

17,28 Bq/m<sup>2</sup>.h (Joint)

Comparison with common materials and building systems

## WALLS

Brick + cement mortar  
2,51 Bq/m<sup>2</sup>.h

Concrete block  
3,01 Bq/m<sup>2</sup>.h

Brick  
7.00 Bq/m<sup>2</sup>.h

Reinforced concrete  
8.05 Bq/m<sup>2</sup>.h

Granite Ashlar  
9.18 Bq/m<sup>2</sup>.h

Borja Frutos. Instituto de Ciencias de la Construcción Eduardo Torroja (CSIC)

## EXPLAINING ACUMULATION

### HYPOTHESIS :

Relevant radon flows from **walls and vaults** could explain the high and homogeneous concentrations

Estimated concentration is compared to measured

Soil + walls

$$C_{Rn} = \frac{\Phi}{(\lambda_{Rn} + \lambda_{ACH}) \times V}$$

Though joints.

150 Bq/m<sup>2</sup>·h

Only Ashlar (without joint)

13 Bq/m<sup>2</sup>·h

Inner wall filler must be responsible of the elevated exhalation rates through joints between ashlars

Total exhalation rate	Vol. (m <sup>3</sup> )	ACH (ventilation + infiltration) (h <sup>-1</sup> )	Radon decay rate (h <sup>-1</sup> )	Estimated radon concentration C <sub>Rn</sub> (est.) (Bq/m <sup>3</sup> )	Measured radon concentration C <sub>Rn</sub> (meas.) (Bq/m <sup>3</sup> )	
Φ (Bq/s)	(m <sup>3</sup> )	λ <sub>ACH</sub> (h <sup>-1</sup> )	λ <sub>Rn</sub> (h <sup>-1</sup> )	(Bq/m <sup>3</sup> )	(Bq/m <sup>3</sup> )	
Tower of Hercules	281	2800	0.38	0.00756	956.9	1133.8

84 % of concordance

High concentration **can only be explained if relevant sources are presented** in the whole tower, not only the soil

## MORE EXAMPLES. Santiago de Compostela. University, church, and administrative buildings

1. WALL. Gneis Rock  
128,19 Bq/m<sup>2</sup>h

2. WALL. Gneis Rock + mortar  
25,54 Bq/m<sup>2</sup>h

3. WALL. Granite Rock  
90,81 Bq/m<sup>2</sup>h

3. WALL. Granite Rock + mortar  
79,64 Bq/m<sup>2</sup>h

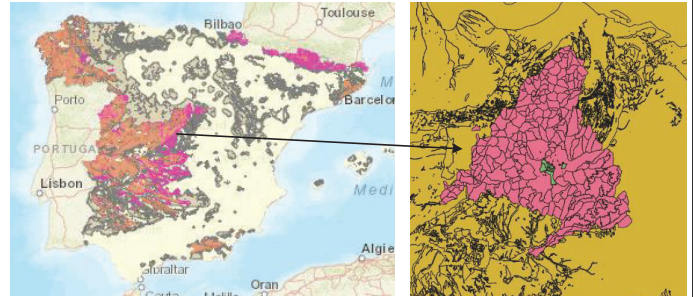

# RADIANT PROJECT. Radon contamination in heritage buildings

Radon Assessment and monitoring using robotics, Digitization, and Artificial Intelligence technologies in heritage buildings

## Studies:

- Non-destructive techniques for analyzing internal filler
- Characterization of radioactive isotopes in building material
- Radon concentration and exhalation monitoring
- Climatic monitoring and correlation with exhalation
- AI Data processing
- 3D Visualization
- Modeling behavior
- Final application: Mitigation techniques in protected buildings

**LABORATORY WALL**

## Some possible demonstrators

St Bernabe Church. El Escorial

El Paular

Monastery of Santa María de Valdeiglesias  
Pelayos de la Presa

Monastery of El Escorial

La Cartuja  
Talamanca del Jarama

University of History and Geography.  
Santiago de Compostela

Borja Frutos. Instituto de Ciencias de la Construcción Eduardo Torroja (CSIC)

## FIRST STEPS: Characterization of radioactive isotopes in building material

Gamma radiation from isotopes in the uranium decay chain can be used as an **indirect indicator**

Ref	Material	Counts	Time	Counts/h
-	Exterior air cavity	3456	60	3456
M7	Gypsum board	743	15	2972
M10	Cement rubble	782	15	3128
M2	Porous cement paving block	786	15	3144
M9	Bamboo	803	15	3212
M8	Standard paving block type 1	811	15	3244
M6	Insulating glass 4/12/4	869	15	3476
M14	Vermiculite	989	15	3956
M3	Coated ceramic tile	1018	15	4072
M16	Standard paving block type 2	1042	15	4168
M17	Perlite	1149	15	4596
M1	Rammed earth	4621	60	4621
M15	Slate	1175	15	4700
M4	Grey clinker paving block	1189	15	4756
M5	Ceramic tile	1190	15	4760
M12	Unpolished granite countertop	1353	15	5412
M11	Polished granite countertop	1363	15	5452
M13	Natural granite paving block	1402	15	5608

Borja Frutos. Instituto de Ciencias de la Construcción Eduardo Torroja (CSIC)

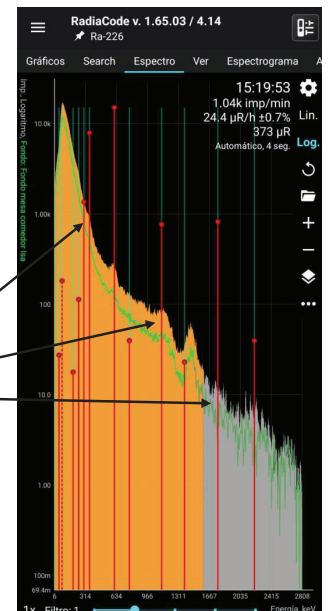

## FIRST STEPS: Characterization of radioactive isotopes in building material

Spectrometry. Studies to determine radioactive isotopes **Pb214; Bi214** (Radium progeny)

Isotopes	Energy (keV)	Canal
Ra-226 *	186.2	77
Pb-214	295	122
Pb-214	352	146
Bi-214	609	247
Bi-214	1120	434
Bi-214	1764	595

Peaks with energy patterns compatible with isotopes of the 226Ra decay chain (**Pb214; Bi214**)

Borja Frutos. Instituto de Ciencias de la Construcción Eduardo Torroja (CSIC)

## FIRST STEPS: Laboratory-scale reproduction of a wall (2 × 1.5 m<sup>2</sup> . 1 m thickness)

Will be used to:

- **Studying radon dynamics exhalation** ( correlated with atmospheric factors)
- **Calibrate a simulation model** aimed at studying radon exhalation behavior and mitigation techniques.

PARAMETERS	Granite	Opus Caementicium
Density [kg/m <sup>3</sup> ]	2650	2400
Permeability [m <sup>2</sup> ]	5.98697E-17	5E-8
Porosity	0.00685	0.4 / 0.2 (juntas)
Diffusion Coefficient [m <sup>2</sup> /s]	5.6307E-10	2.4E-6
Radon Generation [Bq/(m <sup>3</sup> ·s)]	0.072616	0.06804

Borja Frutos. Instituto de Ciencias de la Construcción Eduardo Torroja (CSIC) 

## FIRST APPROACHES: CFD MODEL (Comsol Multiphysics)

Studying radon fluxes through **Ashlar and Joints vs. indoor pressure**

Fluxes

CONTRIBUTION		
	Granite Ashlar	Joints
Bq/m <sup>2</sup> ·h	17.68	169.8

Influence of pressure in flux

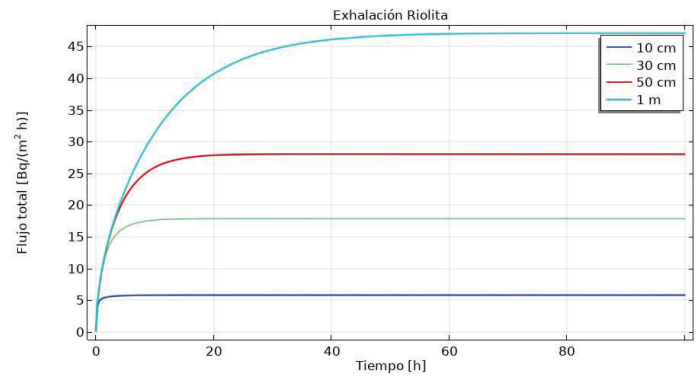

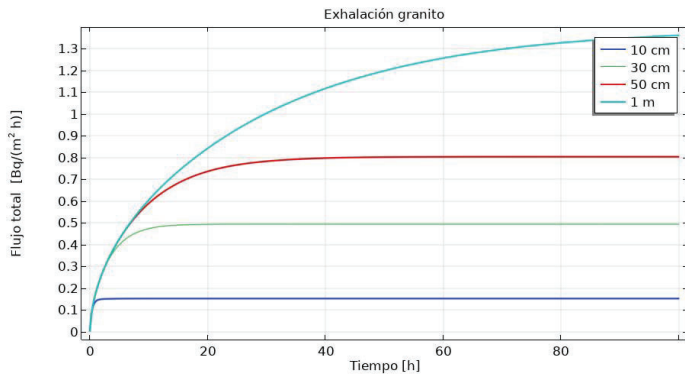

Borja Frutos. Instituto de Ciencias de la Construcción Eduardo Torroja (CSIC) 

# CFD MODEL. DIFFERENTS EXHALATION RATE FROM MATERIALS

	Granito	Riolita
Contenido Ra	90 Bq/m <sup>3</sup>	95 Bq/m <sup>3</sup>
Permeabilidad	6E-17 m <sup>2</sup>	1E-11 m <sup>2</sup>
Porosidad	0.015	0.35
Densidad	2650 Kg/m <sup>3</sup>	1500 Kg/m <sup>3</sup>

# CFD MODEL. RADON MITIGATION APPROACHES

- Sealing joints.
- Applying radon barrier coating  
Compatible with heritage protection

Thanks for your attention!
