ABSTRACT

This talk presents the Air Infiltration and Ventilation Centre AIVC, the Building and ductwork airtightness platform TightVent, and the platform for resilient ventilative cooling venticool. These organisations are knowledge and dissemination platforms which collect information and create knowledge by collaboration with international partners, and have a long history.

The AIVC (Air infiltration and Ventilation Centre) is the International Energy Agency's information centre on energy efficient ventilation, which was created in 1979. The AIVC's main goal is to provide reference information on ventilation and air infiltration in the built environment with respect to efficient energy use and good Indoor Environmental Quality (IEQ), in collaboration with other international organisations such as TightVent and venticool. Since 2011, AIVC activities have been structured around thematic projects, resulting in different dissemination outputs, for example webinars, conference sessions, information papers, and technical reports..
